Benefits of Cord Blood Banking: Lifesaving potential for your whole family

You are making an investment today that may deliver health benefits long into the future. Your newborn infant's umbilical cord blood is rich with stem cells. They have the ability to create all other specialized types of cells found in the body.

Cord blood cells have the potential to treat a variety of life-threatening diseases. Banking your child's cord blood is a once-in-a-lifetime opportunity. **But to ensure this resource is available to your family without limitation, we believe this will be true only if you bank these cells the "right way".**

The DomaniCell Advantage: The right way to banking stem cells

We at DomaniCell believe in the importance of storing cord blood stem cells in a manner which exceeds most current industry standards for existing therapies. Most cord blood banks in the USA are satisfied with complying to what is called FDA's cGTP standard because current therapies using cord blood stem cells only require this kind of compliance.

The higher cGMP standard, however, is currently required for more complex cell therapies presently in clinical trial and being developed as future therapies such as those in current clinical trials for Alzheimer's, Multiple Sclerosis, Diabetes, spinal cord injury, and many other diseases.

Of course cord blood stem cells banked under cGTP are perfectly suitable for today's therapies, such as stem cell transplantation. But we believe that cGMP-compliant cord blood banking will be critical to the use of these stem cells for future therapies.

If for the same price, you could choose to store your child's umbilical cord blood stem cells under cGMP and thereby not limit the future potential use of those cells in more complex therapies, isn't that an advantage worth taking? **Why risk limiting the potential use of those cord blood stem cells even before they are stored?**

The Right Team Makes a Difference: Cord blood banking by cell therapy experts

DomaniCell's management team has over 135 years combined experience in cell therapy. The company has served over 100 leading organizations including stem cell banks, academic stem cell transplant and clinical cell therapy programs, and companies developing cell therapy products. We have worked with over 20 different types of cells and created over 17,000 cell therapy products approximately 5,000 of which have already been used for treatment of genetic, infectious, cardiovascular, neuronal, corneal, and orthopedic diseases, immune system failure, cancer, ulcers, burns, etc.
